The Components Every Heat Pump Landing Page Should Have

By Emily Silverman | June 9, 2021

Heat pump popularity is growing fast! Is your website ready to capitalize on the demand? Set yourself up for success by following Energy Circle's step-by-step guide to creating a long-form heat pump landing page that captures leads.

A long-form heat pump landing page is the workhorse of your website. When structured correctly, it will attract organic traffic, provide users with helpful, relevant information, and most importantly, capture leads. In the infographic below we detail the essential components of a high-performing heat pump landing page.

8 Components Every Heat Pump Landing Page Should Have

Heat pump popularity is growing fast! Is your website ready to capitalize on the demand? Set yourself up for success by following Energy Circle's step-by-step guide to creating a long-form heat pump landing page that captures leads.

A long-form heat pump landing page is the workhorse of your website. When structured correctly, it will attract organic traffic, provide users with helpful, relevant information, and most importantly, capture leads. Here are the components of a successful heat pump landing page:

Relevance
This section is often referred to as the hero. It should feature a high-quality image and a clear, compelling headline that lets users know they're in the right place and makes them want to keep reading.

Call to Action (CTA)
Every landing page should have a prominently displayed call to action. Provide a specific, compelling reason why users should contact you, and make it easy for them to do so.

What Is HOPE for HOMES and Why Is It Important?

By Lily Collins | June 23, 2021

On a recent Webinar Wednesday, Energy Circle hosted Kara Saul Rinaldi, VP of Government Affairs at the [Building Performance Association \(BPA\)](#) to discuss the HOPE for HOMES Act, and to learn how the legislation, if passed, could support progress in our industry for years into the future.

We don't often discuss legislation or what's going on in Washington. However, when government or political initiatives could impact the Better Building Industry and the companies we serve, we're glad to dedicate some time to exploring those possibilities, and learning more about what we can do to support the causes that will benefit our community.

We learned a lot from the conversation between Energy Circle Founder and CEO Peter Troast and Kara Saul Rinaldi during the [An Update on the Hope for Homes Legislation webinar](#), and are excited to dive into greater detail today, as well as share some even more recent news about the proposed legislation.

What Is the HOPE for HOMES Legislation?

HOPE for HOMES is a bipartisan bill introduced in 2020 and reintroduced in 2021 to both the House and the Senate. The Building Performance Association is advocating for its inclusion in any federal infrastructure package because it ["offers multiple approaches to help upgrade homes and multifamily buildings while offering support for contractor training and incentives for energy efficiency upgrades."](#) The legislation has support from leading representatives on both sides of the aisle, and was included in President Biden's budget request, [FY22](#).

How Does HOPE for HOMES Affect Contractors?

The HOPE for HOMES initiative is designed to help contractors by funding technical career and business training. Because the \$500 million initiative would improve access to education through online training, contractors would be able to learn just as much from the heart of a metropolitan area as they could in a more

VIDEO: Overcoming Customer Heat Pump Objections

By Jake VP | June 30, 2021

Does your sales team know how to respond when a customer brings up common objections to heat pump upgrades? Watch in our latest video as the Energy Circle team reenacts some of the most familiar myths and misconceptions about this energy efficient technology, giving you actual examples your business can use to overcome homeowner hesitancy and successfully market and sell heat pumps.

Mechanic Street Passive House

An Affordable, Replicable Passive House

General	Building and Site Details	Energy	Envelope and Mechanicals	Design Process	Finances
-------------------------	---	------------------------	--	--------------------------------	--------------------------

Mechanic Street Passive House rainscreen detail

When the Hevenor family approached Steve DeMetrick of DeMetrick Housewrights about building their new home in Wakefield, Rhode Island, they already knew that they wanted a Passive House. This young family of four had purchased an infill lot close to the bike path, easily walkable to the grocery store and the local elementary school. They were looking to build an affordable new home, and liked the predictability that comes with building a Passive House—in many ways eliminating many of the big decisions that come with designing and building any new home.

Steve DeMetrick and architect Steve Baczek worked with the clients to design and build a simple three-bedroom, two-bath home which was builder- and supplier-friendly, using conventional and easily-available building materials. The builder-architect team worked closely with the clients from the beginning as an integrated team, and everyone on the project was committed to the goals of affordability and replicability.

The building features Schuco triple-paned windows and a finished concrete floor (beneath which lies six inches of foam with an insulating R-value of 26). Double-stud walls provide room for 12 inches of thermal insulation (totaling R-55). Blown-in cellulose insulation in the roof is calculated at R-92. By keeping the building's shape simple, the team was able to complete the project for a total construction cost of \$300,420, or \$163.00 a square foot. As the first PHIUS-certified Passive House in Rhode Island, this project sets the standard for helping to bring Passive House into the mainstream.

HIGH SCHOOL, MAINE COAST WALDORF SCHOOL

Warren Construction Group is proud to have built the first PHIUS certified Passive House High School in the United States. Working closely with the Maine Coast Waldorf School building committee and Briburn Architecture we collaboratively made decisions that carried this project forward. This addition to the Waldorf School campus in Freeport expanded the capacity of the school and brought all the students on to one campus.

HOME PERFORMANCE
KITCHEN & BATHROOMS
LIVING SPACES
WHOLE HOUSE

A Cambridge Retrofit Does More Than Save Energy

When the owners of this 1873 home came to us they were at their wits end: they couldn't stay warm in the winter no matter how high they turned up their heat; they had a major mouse problem; and the wife was suffering from health issues that she felt were exacerbated by indoor pollutants. The homeowners loved their house, with its charming period architectural details, and they loved its location in a vibrant neighborhood of Cambridge. But its poor energy performance and air quality were detrimental to their quality of life.

Benefits

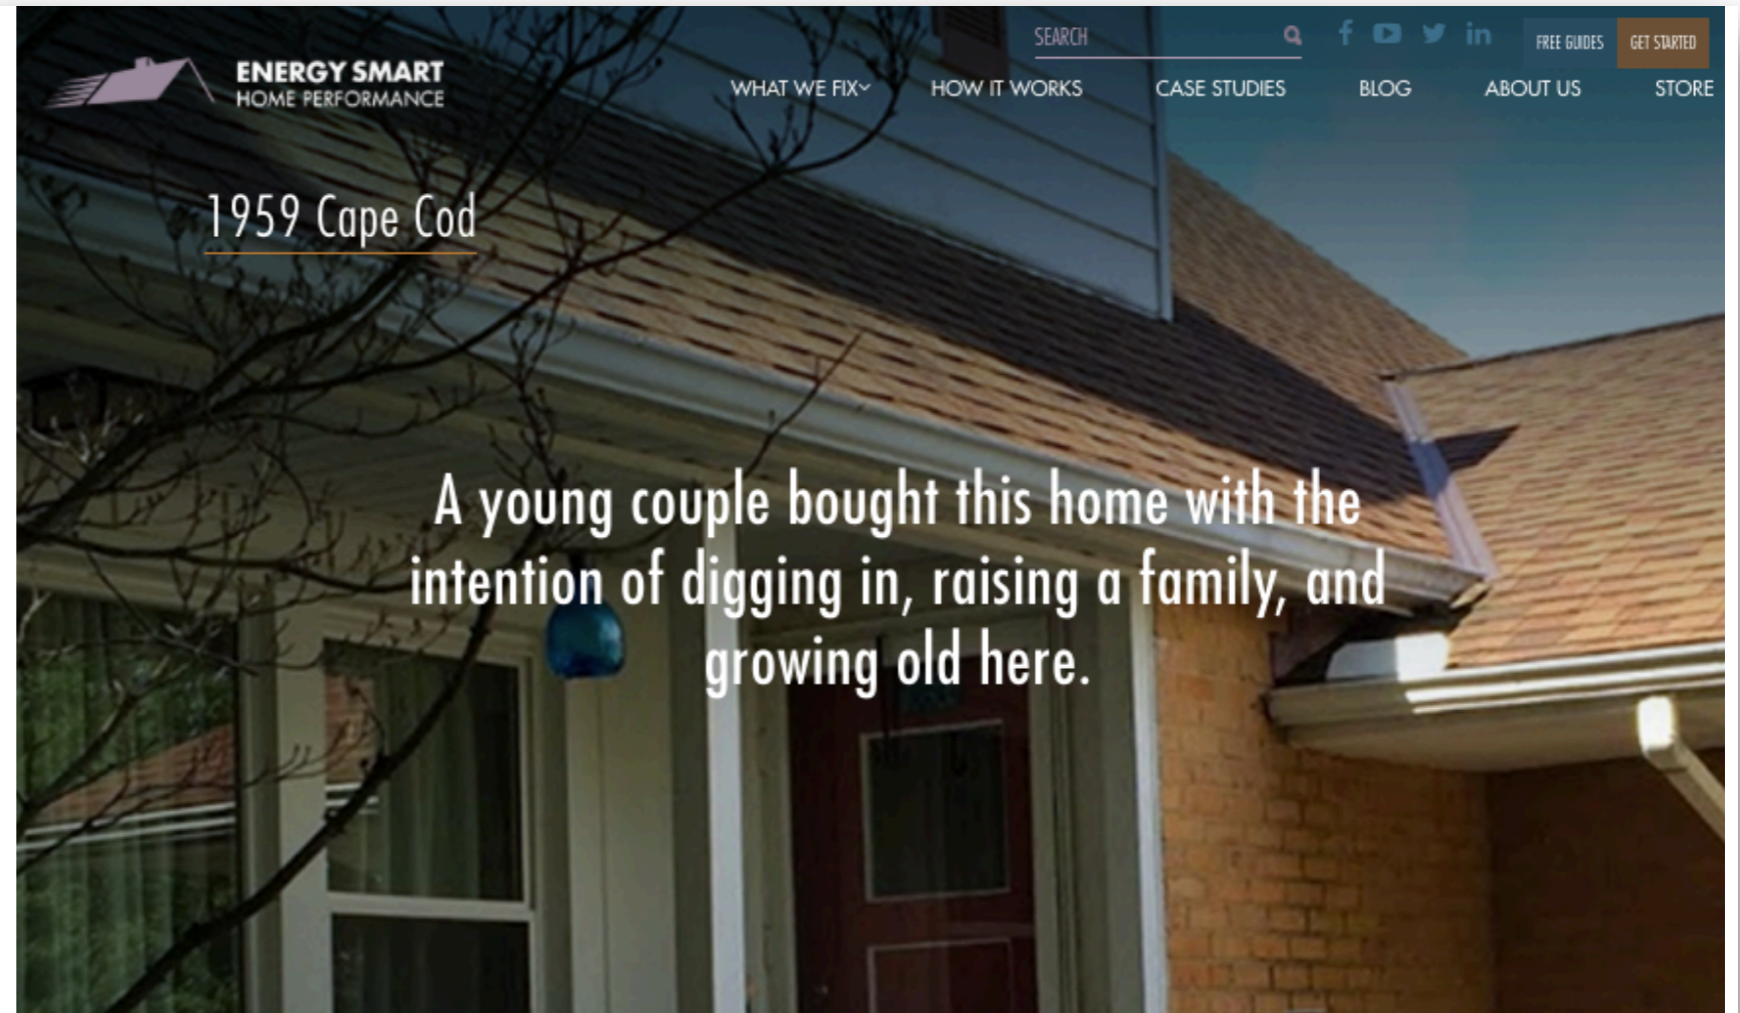

COMFORT & HEALTH
EFFICIENCY

Byggmeister's Solution

We quickly identified the basement as a major contributor to their air quality woes. The rubble foundation offered myriad entry points for mice, and the dirt floor admitted soil gases. In addition, a great deal of old wood and cardboard stored in the basement was rotting and moldy. Because the basement wasn't sealed from the rest of the house, contaminants that originated there eventually permeated the entire house.

Home Performance:

Full Story
Major Fix
Long Form

The second floor nursery was as much as 15° warmer in the summer. Not the best place for their new son.

After the audit and improvements, the difference was less than 2°.

The Background

Year Built 1956

Home Performance:

Full Story
Major Fix
Long Form

The Background

A young couple bought this home with the intention of digging in, raising a family, and growing old here. The problem was the nursery on the second floor got so hot that they were concerned about their first son sleeping there (a second son has arrived since the project!) It was as much as 15 degrees warmer in summer! In winter much of the home was uncomfortable, and during a prolonged power outage the indoor temperature dropped drastically, reminding the owners of their time in New York during Hurricane Sandy and leaving them feeling uneasy about their new home.

Problems to Fix

- During a 6 hour power outage, the indoor temperature dropped 20 degrees. Frozen pipes are a concern.
- Second floor comfort is abysmal through much of the winter and summer. Concern for kids' health.
- Guest room is above master, it's easy to hear each other through the floor.
- Icicles ripped a gutter off and damaged the air conditioner as they fell.

Results

- It took 26 hours to drop 10 degrees with similar outdoor conditions (30-40 outdoor temperatures.)
- No more than 2 degree difference between upstairs and down, most of the time is imperceptible.
- Quieter between guest and master, although there is still room for improvement (which would require a substantial upgrade.)
- Substantially reduced icicles.

The Story

Adam and Rena called us for a pretty typical Cape Cod problem - the second floor never heats or cools well. Capes are usually light on ductwork to the second floor, plus they are usually the leakiest home type.

As usual it took several trades to make the job happen. Adam and Rena wanted to add a few light fixtures, so that brought in an electrician (B to Z Home Improvements.) There was no hatch to the upper attic or an

Mt. Pleasant Home Case Study: Insulating & Air Sealing a Historic Home

"They stayed within the limits of their initial \$29,300 proposal, were timely and efficient, worked well around our operations and kept our facilities clean, and demonstrated considerable expertise and hustle... We wish we had more contractors that can provide the value and expertise that we received so readily from A-A Exteriors." – Mt. Pleasant Home

About Mt. Pleasant Home

Built in the 1850's, this mansion is set on a landscaped five-acre bluff-top in a quiet, centrally located residential neighborhood. This Mt. Pleasant Home provides affordable independent living for forty residents in a 30,000 square foot facility. The three main buildings were constructed in 1857, 1894, and 1939.

Having been built in multiple stages, it proved to be unique in the many strategies that were applied to complete the air barrier and insulation project.

The building showed substantial evidence of a lack of a sufficient air barrier and thermal barrier throughout. Many

NOW MUCH MORE COMFORTABLE

Just a quick note about the air sealing that you did in our home. It has worked as you indicated that it would. We noticed an immediate improvement in our basement. We obviously had some problems in that area that one would not normally associate with a nine year old home. The temperature in the basement is now much more comfortable and the kids seem to play down there more often.

Temperature Swings in Los Angeles

Building Doctors

Greg Stevens was experiencing many issues with his 1700 sq ft home in Los Angeles, CA. The Spanish-style building was built in 1932 and was extremely drafty. He was unhappy with the extreme swings in temperature and keeping the home cool or warm was a constant battle. The dust in the house was also a health concern.

ENERGY AUDIT RESULTS

After doing an energy evaluation of the home, Dan Thompsen, a BPI Gold Star Certified Contractor and owner of Building Doctors was able to identify some of the major issues causing the uncomfortable temperatures and dust. The wall furnace needed to be updated, there was absolutely no wall insulation and the house was very leaky. There was also an out of date and inefficient water heater.

SOLUTIONS

Dan and his team of professionals were able to take a whole home approach to the project and make changes that would make the entire home function more efficiently so the home was more comfortable and healthy. They air sealed many areas of the home that were causing the air to leak in and out of the home. They added attic insulation and wall insulation where there was none before. They combined the home's hydronic heating and air conditioning system installed a Rinnai tankless water heater.

PROJECT OUTCOME

The comprehensive work that was done made a substantial difference in the comfort of the

Single family green building certification continues to expand in the marketplace through a combination of consumer demand and code requirements. Several local municipalities are either requiring or incentivizing certification for new homes and major renovation projects. Contrary to common wisdom, when green building and energy efficiency techniques are considered early in the design phase, additional expenses are minimized or eliminated, and projects are assured a smooth path to certification. We work with developers, architects, and contractors to make sure that their projects meet program requirements, helping them to create affordable, comfortable, healthy, and efficient homes that their clients love and improve their reputation.

HOW SK COLLABORATIVE CAN HELP YOU BUILD AND RENOVATE BETTER HOMES

- Consult with you early in the design process to plan for certification from the start
- Help you make the best decisions first
- Avoid mistakes during construction that cost time and money
- Green building means happier clients and fewer callbacks
- When you plan green from the start, it is easy and doesn't have to cost more

About the Project Equipment Specifications

In an effort to move their operations toward net zero, the owners of [Black Locust Farm](#) installed eighty (80) American-made SolarWorld Sunmodules and installed two ducted heat pumps. Black Locust Farm is home to cashmere goats and serves as a bed and breakfast.

Due to the scale of the project, the owners opted for a ground-mounted system. The site is uneven and has shallow ledge, which somewhat limited our options for installation a foundation for the array. We utilized a Schletter PV Max ballasted ground frame to alleviate these challenges. The system utilizes poured-in-place concrete grade beams which sit upon crushed stone to provide drainage and minimize the effects of frost.

This project includes four (4) SMA Sunnyboy transformerless inverters, each connected to the internet to allow for remote monitoring of system performance and functionality. The inverters are capable of exporting a total of 24,000 watts of power to the grid. In order to integrate this system into the existing electrical system, we were required to install a line side interconnection between CMP's meter and the main service panel. We also needed to coordinate the replacement of the transformer at the site to accommodate the magnitude of electricity that could be delivered to the grid.

Mallett Deep Energy Retrofit, 57 Depot St, Freeport, ME

March 26, 2013 ·

The Mallett House Case Study is now up on the Building Science Corporation website. (Our consultants and the world's leading building scientists.)

Building Science Consulting

The Mallett House Retrofit is a deep energy retrofit of 57 Depot Street; one of several worker cottages built in 1886 for employees of the local shoe factory. In 2010, BSC was retained by Freeport Community Services to propose retrofit enclosure assemblies.
